general feedback

- don't show summaries, only show what I need to see – please only use *head*
  - or extract only the necessary bits: *summary(modelC1)$coefficients["attitudepol", "Std. Error"]*
- when plotting, plot the model, not smoothed lines
- no interaction needed for no-pooling model, you shouldn't model slopes
- make sure you use (n-p) correction for variance – the *sigma* function will do this
- for pdf's make sure that you stay within margins
- don't remove the missing values – this is also information about the data
- Remember to use the grading assignments formatting when answering questions
- I made an error in writing interval and ratio variables must be continuous
- assignment deadlines – only if you want to be included in feedback
